

Obstetrics and gynaecology

WHAT IT DOES

Provides an in-depth analysis of the obstetrics and gynaecology service across a wide range of metrics from a number of data sources. It enables trusts to benchmark performance against a national picture to easily identify areas of variation.

Aimed at divisional service leads, quality and improvement leads, clinical consultants and midwives, it allows you to focus on the key areas within maternity and women's services to compare your performance to peers and improve patient safety and outcomes.

WHAT IT DELIVERS

A bespoke consultancy service following a multi-stage, integrated approach to help clients to access data and insights, including advanced analytics, and make evidence-based decisions on areas for improvement.

The service identifies areas where the organisation is an outlier for a range of metrics, and offers indirect standardisation for each metric enabling appropriate benchmarking. It also provides a view of care pathways across geographical boundaries.

It focuses on benchmarking in three areas:

1. Gynaecology
2. Gynae-oncology
3. Obstetrics

Adverse events – an overall measure of the quality of care

We have developed an overall measure of the quality of care delivered within a hospital setting. Based on HES data, this patient-level metric comprises five generic component events that can be separately analysed to assess whether a patient has experienced any adverse events during their hospital stay.

The five components include:

1. Death
2. Safety
3. Complication
4. Readmission
5. Length of stay outlier

Our clinical spotlight consultancy includes four stages:

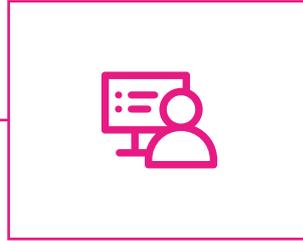

Scope

Meet to identify bespoke areas of focus.

Analyse

Review metrics and identify areas of variation.

Present

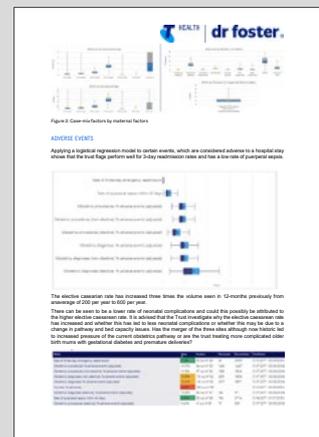

Present findings for discussion and reflection.

Report

Provide final report with recommendations for action.

REPORT VIEW

BENEFITS

- ✔ Compare your organisation nationally and reduce clinical variation across maternity and women's services.
- ✔ Save time and effort with our team of consultants interpreting the data and providing insight to your teams.
- ✔ Drive quality and operational productivity and track continual performance improvement.
- ✔ Inform the planning and design of maternity and women's services incorporating patient safety strategies and measures.
